**Abstract**

This paper deals with recording information on distribution, ecology, and potential of Vetiver grass in Bangladesh primarily based on field trips conducted in forty districts of Bangladesh during June-August 1995. The study indicates that Vetiver is a very common grass in Bangladesh. A 2 Km area in the district of Cox's Bazar has so far been recorded as the largest patch of Vetiver population in the country. Information gathered reveals that Vetiver is being employed for a number of uses in Bangladesh and has great potential as a soil stabilizer which has so far been ignored in the country.
