Abstract

The studies on planting date of vetiver grass were carried out in different parts of Thailand. The results showed that during 30 May – 30 July were the appropriate planting date as vetiver can established very well before the onset of heavy rain and gave more than 90% of survival. Vetiver can be planted during 15 August – 30 September, but the tillering was not so good which would reduce the effectiveness of vetiver. In general the height of *Vetiveria zizanioides* was 120-140 cm. which was higher than *Vetiveria nemoralis* (90-110 cm.) It was also found that the growth of vetiver was very rapid 90 days after planting.
